

DealFlow Documentation Master Index

The controlled documentation system for building and operating DealFlow as a serious product

Cherry • DealFlow • Master Index • Version 1.0 • September 2026

1. Why This Documentation System Exists

DealFlow should be developed and operated like a serious product-company product. Documentation is not paperwork for its own sake; it creates shared understanding, controlled change, faster development and safer continuous improvement.

2. Required Core Set

- 01 Product Requirements Document — what the product must do.
- 02 Business Requirements Document — why the business needs it and how success is measured.
- 03 UX & Interaction Design Specification — how customers experience it.
- 04 Domain & Data Model — what business data means and how it evolves.
- 05 System Architecture — how the system is built.
- 06 Security & Privacy Architecture — how trust and data protection work.
- 07 API & Integration Standards — how systems communicate and evolve.
- 08 Testing & QA Strategy — how quality is verified.
- 09 DevOps, Release & Operations Runbook — how the product runs safely.
- 10 Product Roadmap & Release Management — how it continuously evolves.
- 11 Customer Onboarding, Support & Success — how customers become successful.
- 12 Product Analytics & Metrics — how decisions are measured.
- 13 Financial & Unit Economics Model — how the product remains commercially viable.
- 14 Legal, Privacy & Compliance Readiness — how customer and company obligations are managed.
- 15 Operational Runbooks & Incident Handbook — how recurring operational problems are handled.
- 16 ADR Governance — how architecture decisions remain understandable.
- 17 Documentation Governance & Traceability — how the documentation itself stays correct.

3. Documents That Must Exist Before Serious Development

Business Requirements
Product Requirements
Domain/Data Model
System Architecture
Security baseline
UX for core workflow
Testing strategy
Development standards
Initial roadmap
Definition of Done

4. Documents That Mature With the Product

API specification
Integration specifications

Detailed threat model
Operational runbooks
Incident handbook
Analytics definitions
Customer support playbooks
Pricing/unit economics model
Legal/compliance readiness
Disaster recovery plan
Performance plan
Capacity plan

5. Documents Created Per Major Feature

Problem statement or product requirement
UX/design decision if applicable
Technical design/ADR if significant
Security/data impact assessment
Acceptance criteria
Test cases
Release notes
Documentation update
Analytics/measurement plan

6. Documents Created Per Release

Release scope
Migration plan
Testing evidence
Security review where relevant
Deployment plan
Rollback/recovery plan
Release notes
Post-release monitoring checklist

7. Documents Created When Incidents Occur

Incident record
Timeline
Impact
Root-cause analysis
Corrective actions
Preventive actions
Regression test or monitoring improvement
Runbook update

8. Ownership Model

Product: business requirements, roadmap, customer value.

Design: UX and interaction standards.

Engineering: architecture, implementation, technical documentation.

Security/engineering: security controls and reviews.

QA: test strategy and release quality evidence.

Operations: deployments, monitoring, incidents and recovery.

Business/finance: pricing, economics and commercial controls.

Legal/compliance: contracts, privacy and regulatory readiness.

9. Documentation Principle

Documents should evolve with the product. A stale document is worse than no document because it creates false confidence.

Every major product decision should have one clear source of truth.

10. Recommended Build Order

Business Requirements → Product Requirements → UX core journeys → Domain/Data Model → System Architecture → Security baseline → Development standards → Testing strategy → V1 implementation → Operations/Release → Analytics → Customer onboarding → Continuous improvement.
